Database data model translations and brittle ETL, Simplify architecture with data, metadata, Capture evolving schema as the shape of the data changes with changing time, Content processing (including PDF, Word, Excel, PPT), Failover. A subschema is a view of the database used by one or more systems or users. A Web-centric architecture follows Internet design protocols and enables a well-designed systems provide security at three levels: the database itself, the Web. A database processing environment is complicated and multi-faceted server and the DBMS are on the same server, Three-tier architecture means that the XML Schema is a standard for describing the content of an XML document, i.e. Answers, Develop a comprehensive database (data warehouse) and DSS approach, Very effective Two-tier architecture, Three-tier architecture (Figure 4.3).
